

The Bone

Seeker

MPI STANNOUS DIPHOSPHONATE (TECHNETIUM Tc 99m ETIDRONATE KIT) CONSISTENTLY SEEKS BONE ... AND BONE LESIONS.

MPI Stannous Diphosphonate targets areas of diagnostic significance. Its reliability is magnified with:

Rapid Blood Clearance. The P-C-P bond of diphosphonate resists hydrolysis; clears the kidneys rapidly. Optimum imaging time is in two to four hours.

Increased Stability. Ascorbic acid within the reagent aids in maintaining tin in its reduced state. The ^{99m}Tc pertechnetate stays where it belongs...tagged to the reagent.

Optimum Tin Levels. The Sn(II) level provides high labeling efficiency, with minimum interference with subsequent brain scans.

Investigate the economy of MPI Stannous Diphosphonate

You can use up to 8 ml of 5 to 15 mCi ^{99m}Tc in each vial. The reagent is usable for six hours after labeling.

You also have no delivery charges when you order MPI Stannous Diphosphonate with any other MPI products.

Ask your Medi-Physics representative about our economical, reliable delivery proceduresor call toll free:

For complete information consult the package insert, a summary of which follows:

MPI Stannous Diphosphonate Technetium Tc 99m Etidronate Kit-Diagnostic

DESCRIPTION: Each ampul contains a total of 1.54 mg of the sodium salt of etidronate, 0.42 mg stannous chloride, and 3.87 mg ascorbic acid in a 2.2-ml sterile, pyrogen-free aqueous solution. Hydrochloric acid and/or sodium hydroxide may have been added to adjust the pH to 2.5-5.0. The solution is under a nitrogen atmosphere. A complex is formed with the addition to the reagent of sterile, pyrogen-free sodium pertechnetate Tc 99m in isotonic saline.

INDICATIONS: Technetium Tc 99m etidronate is used as a bone imaging agent to delineate areas of altered osteogenesis.

CONTRAINDICATIONS: None known.

WARNINGS: This radiopharmaceutical should not be administered to children, pregnant women, or nursing mothers unless the expected benefit outweighs the potential risk. Radiopharmaceutical examinations of women of childbearing capability should be performed during the first few days following the onset of menses.

PRECAUTIONS: To minimize radiation dose to the bladder, the patient should be encouraged to drink fluids and void when the examination is completed and as often thereafter as possible for the next 4-6 hours. Where feasible, brain scans

should precede bone imaging procedures. Technetium Tc 99m etidronate should be formulated, following aseptic procedures, within 6 hours prior to clinical use.

ADVERSE REACTIONS: Seven suspected reactions to technetium Tc 99m etidronate were reported in more than 22,500 clinical reports. There were two instances each of headaches and allergic reactions and one each of vomiting, rheumatoid arthritis flare-up, and skin rash.

DOSAGE AND ADMINISTRATION: The suggested adult dose is 5-15 mCi administered by slow I.V. injection. Do not administer more than 2.0 ml of unlabeled reagent per patient. Measure the patient dose with a suitable radioactivity calibration system immediately prior to administration. Scanning post-injection is optimal at 2-4 hours.

Radiopharmaceuticals should be used only by physicians who are qualified by specific training in the safe use and handling of radionuclides and who have been approved by the appropriate government agency.

HOW SUPPLIED: Each kit package contains five sealed glass ampuls as described above, five sterile, pyrogen-free mixing vials, five each of mixing-vial and record labels and one package insert. Store at 5°-8°C; protect from light.

NEW FROM TRACOR NORTHERN

TN-1710 MICROCOMPUTER BASED MODULAR MCA

STANDARD FEATURES

- Large 6.5" CRT display with alphanumeric character generator
- Simultaneous acquisition and spectral readout
- Log display plus Tracor Northern's exclusive autoranging feature
- Regions of interest with gross integral and net integral above background
- Unique bipolar or unipolar memory display
- Cursor for region of interest and individual channel selection
- LSI-11* microcomputer-based
- Field expandable with extra memory and new function modules
- Additive and subtractive transfer
- X-Y analog output for recorders or plotters with alphanumeric character plotting
- New modular chassis capable of housing a wide variety of ADC and scaling inputs plus many data processing and display options
- Interface for teletype or serial printer
- Multiple regions of interest with overlapping region limits

Low-priced Compact Powerful features.

The TN-1710 features the new LSI-11[®] microcomputer, far superior to simple microprocessor components for power and flexibility. The TN-1710 also offers a wide range of modules so you can be sure of a system tailored to your needs. This innovative data acquisition system is available now at a remarkably low price.

SIGNAL INPUT MODULES AVAILABLE

- Choice of 50, 100 or 200 MHz ADCs
- Multiple input scalars (MCS)
- Preamplifier/amplifier for scintillation detectors
- Detector high voltage supplies, 2kV or 5kV
- Multiplex/routers for multiple PHA inputs

DATA PROCESSING MODULES AVAILABLE

- Energy and time calibration for PHA/MCS data
- Data processing including smoothing, stripping, normalization, plus spectrum integration and differentiation
- Automatic learn mode for operation of complex analysis sequences
- Peak or region of interest ratio
- X-ray, K, L and M line markers

INPUT/OUTPUT INTERFACES AVAILABLE

- EIA, RS-232C
- Parallel printer interface
- Paper tape punch and reader
- Floppy disk

The Baptist Memorial Hospital has widened its image horizons. With the 91-tube Cameray XL.

The Baptist Memorial Hospital in Memphis, one of the nation's biggest and busiest medical institutions, is getting more patient per scan these days. At the same time, the nuclear medicine section, under Doctors John Rockett and Mohammed Moinuddin, is getting high resolution images with every reading. The Cameray XL-91 is on the scene.

Cameray XL-91 just might be the ultimate gamma camera. Because it offers you the widest undistorted field of view you can get. A big 16½

inches. And it's the first wide field gamma camera to produce high resolution images equivalent in all respects to smaller field cameras.

And Cameray XL-91 offers you a choice of console combinations. Or, if you're already a Cameray II owner, a quick conversion. So widen your image horizons. With Cameray XL-91. Contact Raytheon's Medical Electronics Operation, Fourth Avenue, Burlington, Mass. 01803. (617) 272-7270. 

A distinguished family.

Varian Clinical Computation Systems

New Dimensions in Advanced Computer Applications

The fast and flexible Varian V-70 series minicomputers and supporting software have, through application in the Varian CT scanner and other medical equipment, proven to be ideal for clinical use. Varian's real-time, multi-task operating systems VORTEX and BETA give wide flexibility and ease of use for busy, patient-oriented environments. Combined with Varian special application software, Varian systems put the most advanced digital data-processing tools at the medical staff's fingertips.

The first standardized clinical system introduced by Varian was VARICAM, a comprehensive nuclear medicine data processing system, now in use in many hospitals around the world. Gamma camera raw-data are directly input to VARICAM and submitted to data processing procedures according to simple operator instructions. VARICAM gives the user unique options for developing his own processing protocols and manipulating data output format. VARICAM processed data are displayed in video black and white, color, or as life-sized hard-copy by the remarkable Varian STATOS® electro-static printer/plotter.

Varian computers are used for many other clinical applications including radiotherapy planning, ultrasound image processing, electro-cardiology diagnosis, and intensive care monitoring.

KODAK: HELPING TURN ENERGY INTO IMAGES.

RADIOGRAPHY · COMPUTERIZED TOMOGRAPHY
ULTRASOUND · NUCLEAR MEDICINE · THERMOGRAPHY

Kodak products. For the constant imaging needs of today's radiography.

Kodak's role in diagnostic imaging stems from almost a century of expertise in photography—out of which Kodak has built a background of expertise in radiography.

And this translates into Kodak products: quality medical x-ray films and intensifying screens that interact with energy to help create diagnostic images.

For general radiography:

Kodak X-Omat RP film—a high-contrast, fast film, providing excellent detail; Kodak X-Omat L film—a wide-latitude film that can record a wide range of tissue densities; Kodak X-Omat G film—a high-contrast film, providing excellent sharpness of detail with a low quantum mottle graininess. And many others ... plus Kodak Lanex screens which, when used with Kodak ortho G film, provide increased speed and reduced patient exposure.

For special imaging technics:

Kodak X-Omat subtraction masking film, as well as Kodak films for radiation therapy monitoring, for duplicating, for cinefluorography, for spot filming, and for photofluorography, and Kodak Min-R screen and film for mammography.

All of these films can be automatically processed in the dependable, 90-second Kodak RP X-Omat processor, model M6A-N—for high-volume radiography; or the smaller, compact, 150-second Kodak RP X-Omat processor, model M7A—for satellite areas. The model

M7A processor uses tap water to wash films, saves on water heating costs. The model M7A processor also offers an energy-saving, standby-control unit that conserves power when the processor is not in use. Both processors can use our carefully formulated chem-

icals that offer potential economies through lower replenishment rates.

Other important tools for turning energy into images: Kodak X-Omatic cassettes. They're durable and lightweight. And they have specially designed curved covers that roll out air to create an intimate screen/film contact when closed, for consistently high image quality.

Kodak products. For the changing needs of the new world of diagnostic imaging.

Kodak has the expertise in how to apply imaging technology to the new diagnostic modalities. And

Kodak has kept pace with the growing needs by providing products that can accurately record the information displayed on cathode-ray tubes or video monitors.

Kodak has films for nuclear medicine; for recording multiple, single, or dynamic images. Both single and double emulsion films. With spectral sensitivities compatible with cathode-ray tube displays.

Kodak also has films for CT scanning, for ultrasound, for thermography that can capture a wide range of gray tones.

The Kodak TSR: The logical link with your world of diagnostic imaging.

Your needs direct the extent of Kodak's help to you and your staff—through the services of your Kodak Technical Sales Representative whose qualifications are based on extensive training and experience in diagnostic imaging. Your Kodak TSR offers personal service and technical expertise directed to producing quality results on the view box. Your TSR can also arrange for seminars, lectures, special training courses for technologists, maintenance training for personnel involved with processors ... or provide manuals, product brochures, technical

publications, technical aid materials, slide lectures, medical charts and audiovisual presentations. Contact your TSR to help you get the most out of your Kodak products and to help you get the most out of your x-ray department. Or consult your medical x-ray products dealer. Or write:
Eastman Kodak Company, Dept. 740-B,
Rochester, New York 14650.

When NDL and DSI asked they meant mobile.

George West and Bill Hinkle, the presidents of Nuclear Diagnostic Laboratories of Irving, Texas and Diagnostic Services Incorporated of Buena Park, Calif., are in the business of taking the latest in medical technology and equipment to hospitals on an "as-required" basis. So when they each decided to put mobile gamma cameras in trucks to improve the quality of the mobile services they offer in their areas, they made exhaustive studies of the equipment available to them.

Their choices? Ohio-Nuclear Sigma 420 mobile gamma cameras with MPC (micro-processor control).

Why Ohio-Nuclear? "Reliability," according to George West. "We have to be able to schedule with certainty, to know our equipment will be available when it is needed. It has to be ready to provide optimum uniformity and resolution as soon as it is wheeled into the hospital. Ohio-Nuclear cameras give us that assurance. They offer us the best value for our investment."

"We have to offer the highest quality instrumentation available, in order to compete in our market area," Bill Hinkle stressed. "We picked Ohio-Nuclear because we think it gives us that. It's reliable, MPC is the most advanced state of the art technology available today, and the Ohio-Nuclear cameras don't lose any of the quality of the images they produce despite being transported in a truck."

Ohio-Nuclear gave them what they wanted.

Sigma 420
Performance Characteristics

Uniformity

$\pm 5\%$ Integral
 $\pm 3\%$ Differential

Resolution

4.5mm FWHM (^{99m}Tc)

Count Rate

200K cps

for mobile gamma cameras,

Reliability is only one factor.

Several other factors helped persuade NDL and DSI.

- The Sigma 420 has the same outstanding uniformity, resolution, and count characteristics as the Ohio-Nuclear Sigma 400 and 410 Series stationary cameras.
- Power drive makes the Sigma 420 easy to move and maneuver.
- With no foot to go under the patient bed, the Sigma 420 can be used in almost any room, regardless of the equipment in the room.
- A built-in data system allows post-study data manipulation and analysis.
- Built-in head protection increases reliability.
- The Sigma 420 maintains high voltage to the PM tubes at all times. This allows instant response with no degradation in uniformity.

Nuclear Diagnostic Laboratories serves the five-state area of Texas, Oklahoma, Arkansas, Louisiana and Mississippi with a complete nuclear medicine and electroencephalographic laboratory. Diagnostic Services Incorporated serves a 2,500-square mile area of Orange and Los Angeles Counties with nuclear medicine, ultrasound and echocardiography.

Despite the vast differences in their operations, both companies decided on Ohio-Nuclear Sigma cameras.

If Ohio-Nuclear Sigma Series cameras can perform that well for them, under those conditions, imagine how well a Sigma 400, 410 or 420 could serve your nuclear medicine department.

TWX No. 810-427-2696

UNBURDEN

Radiation safety is always a compromise. The ideal exposure is none. The protective clothing shown is not always practical. That's why we've "tamed" technetium and put it into a unit-dose system that makes it easier and safer to handle.

The CINTICHEM[®] System reduces both the radiation burden and the labor of imaging agent preparation by effective shielding and by automating isotope measurement, dose volume calculations, dose preparation and final dose assay.

RELATIVE ABSORBED RADIATION DOSE (in mrem/hr)

Source of Data: F. D. Rollo, M.D., PhD., Associate Professor of Medicine & Radiology, University of California, San Francisco, and Director, Nuclear Medicine Service, Veterans Administration Hospital, San Francisco. Data on file.

YOURSELF.

At the same time, it reduces the 24 typical steps in the manual method of preparing the initial patient dose—and the 13 in subsequent doses—to just five each. The CINTICHEM Dispenser constantly subtracts background activity and displays available technetium concentration, checks for moly breakthrough, makes two independent measurements of the dispensed dose, and signals you if anything's amiss.

Chances of reagent stability problems occurring are lessened and decay calculations are eliminated because each dose is prepared as needed, not before. The unique lead glass syringe shield allows you to withdraw accurate doses with rapid visual observation. And throughout the system, strict Union Carbide quality control assures you of accurate, safe agent preparation with dependable, rugged, precise equipment.

You can unburden yourself from radiation safety problems in imaging agent preparation. The CINTICHEM System tames technetium to help you do it.

NEW...automatic **XDS** **(Xenon Delivery System)**

For the busy department that demands operating ease, speed and efficiency in ventilation and perfusion studies using any radioactive xenon

- Push-button control.
- All functions facilitated by two internal blowers.
- Resistance-free patient breathing.
- Uses 20-liter breathing bags in fully-shielded chamber.
- Accepts any radioactive xenon... ^{133}Xe , ^{127}Xe , ^{125}Xe .

XDS makes lung function studies easier for both the patient and the technologist. With "up-front" push-button controls and two internal blowers doing the work, the patient enjoys resistance-free breathing; the technologist has full control of each programmed function at his fingertips. Studies are fast, efficient and effortless.

XDS— the system with the versatility and performance features of more-expensive systems.

Control Panel

Each programmed function is controlled by two in-system blowers which are independent of the patient's breathing efforts. From "Fill" to "System Washout" the blowers automatically balance the breathing circuits, providing resistance-free patient breathing and complete system clearance.

J&S Model 145A Portable Localization Monitor for I-125 Labeled Fibrinogen Scanning.

Early detection of deep vein thrombosis of the legs can be accomplished using I-125 labelled fibrinogen and the Model 145A.

The leg is scanned after intravenous injection of the labelled fibrinogen. As a thrombosis develops, the radio-active fibrinogen is detected at predetermined points and measured directly as a percentage of the pre-cordial count.

Handily compact and portable, with standard D cell battery operation providing at least 100 hours of uncycled use, the 145A Localization Monitor offers unlimited isotope selection, stainless steel collimator, and solid state design.

Features

- Direct *Percentage* Analog Display
- Compact & Portable (6½ lbs including batteries & probe)
- Powered by 3 flashlight batteries (No A.C. Hazards)
- Unlimited Isotope Selection

Specifications

Range: Percent Scale — 0-120%
CPS Scale — 30, 100, 300,
1000, 3000 CPS

Meter Response: Fast — 2 seconds
Slow — 14 seconds

Dimensions: 4½" H × 5½" W

Early detection of Deep Vein Thrombosis

In cancer management

periodic CEA-ROCHE assays may detect recurrence of disease months before other clinical signs are evident

Therapeutic Response Curve

CEA-ROCHE, when used as a biological marker for following the cancer patient's response to therapy, should be employed periodically to determine a trend. The first test (preferably taken prior to beginning treatment) is used as a baseline against which subsequent tests are measured. Investigators have recommended that assays be run every 3-4 weeks during periods of active therapy, then once every 1-2 months for the first six months after completion of therapy; and finally, every 6-12 months as part of the long-term follow-up.

Results of periodic CEA-ROCHE assays have been found to closely mirror clinical response to therapy. Effective therapy normally results in a drop in an elevated CEA titer to levels below 2.5 ng/ml. Conversely, CEA titers usually remain elevated in the presence of refractory disease or when therapy is unsuccessful.

CEA-ROCHE

Carcinoembryonic Antigen assay

a valuable adjunct to other laboratory tests
for monitoring the cancer patient's status

Four years of extensive clinical use have shown CEA-ROCHE to be an important part of the total management program for patients with internal carcinoma: breast, lung, GI and GU tracts. Used periodically, this assay is a valuable means of...

- monitoring the effects of surgery, radiation or chemotherapy
- indicating the need for a change or re-evaluation of therapy
- suggesting the recurrence or progression of disease

CEA-ROCHE may be ordered from

- Roche Clinical Laboratories, Inc.
Five Johnson Drive
Raritan, New Jersey 08869
(201) 526-2400
800-631-5250
- Major hospital and private laboratories

ROCHE

Progression/Recurrence Curve

The importance of periodic CEA-ROCHE assays for the prompt recognition of tumor progression/recurrence has been found to be "crucial in the clinical follow-up of these [cancer] patients." The same report also showed that progressively rising titer levels often preceded actual clinical relapse by weeks to months.*

? Lymphoma
? Hodgkin's disease
? Bronchogenic carcinoma

Gallium Ga 67:

Now available for routine use as
a non-invasive adjunct in diagnosis.

Indications and Usage: Gallium Citrate Ga 67 may be useful to demonstrate the presence and extent of certain malignancies such as Hodgkin's disease, lymphomas, and bronchogenic carcinoma. Positive Ga 67 uptake in the absence of prior symptoms warrants follow-up as an indication of a potential disease state.

Contraindications: None known.

Warnings: Gallium Citrate Ga 67 should not be administered to children or to patients who are pregnant or to nursing mothers unless the information to be gained outweighs the potential hazards. Ideally, examinations using radiopharmaceutical drug products, especially those elective in nature of a woman of childbearing capability should be performed during the first few (approximately ten) days following the onset of menses.

Precautions:

General

A thorough knowledge of the normal distribution of intravenously administered Gallium Citrate Ga 67 is essential in order to accurately interpret pathologic studies.

The finding of an abnormal gallium concentration usually implies the existence of underlying pathology, but further diagnostic studies should be done to distinguish benign from malignant lesions. Gallium Citrate Ga 67 is intended for use as an adjunct in the diagnosis of certain neoplasms. Certain pathologic conditions may yield up to 40% false negative gallium studies. Therefore a negative study cannot be definitively interpreted as ruling out the presence of disease.

Lymphocytic lymphoma frequently does not accumulate Gallium Ga 67 sufficiently for unequivocal imaging; and the use of gallium with this histologic type of lymphoma is not recommended at this time.

Gallium Citrate Ga 67, as well as other radioactive drugs, must be handled with care and appropriate safety measures should be used to minimize external radiation exposure to clinical personnel. Also, care should be taken to minimize radiation exposure to patients consistent with proper patient management.

Carcinogenesis

No long term animal studies have been performed to evaluate carcinogenic potential.

Pregnancy Category C

Adequate reproduction studies have not been performed in animals to determine whether this drug affects fertility in males or females, has teratogenic potential, or has other adverse effects on the fetus. Gallium Citrate Ga 67 should be used in pregnant women only when clearly needed.

Nursing Mothers

Gallium Citrate Ga 67 has been found to accumulate in breast milk and should not be used in nursing mothers.

Pediatric Use

Safety and effectiveness in children have not been established.

Adverse Reactions: Severe itching, erythema and rash were observed in one patient of 300 studied.

Dosage and Administration: The recommended adult (70kg) dose of Gallium Citrate Ga 67 is 2-5mCi. Gallium Citrate Ga 67 is intended for intravenous administration only.

Approximately 10% of the administered dose is excreted in the feces during the first week after injection. Daily laxatives and/or enemas are recommended from the day of injection until the final images are obtained in order to cleanse the bowel of radioactive material and minimize the possibility of false positive studies.

Studies indicate the optimal tumor to background concentration of ratios are often obtained about 48 hours post-injection. However, considerable biological variability may occur in individuals, and acceptable images may be obtained as early as 6 hours and as late as 120 hours after injection.

The patient dose should be measured by a suitable radioactivity calibration system immediately prior to administration.

Radiopharmaceuticals should be used by persons who are qualified by specific training in the safe use and handling of radionuclides produced by nuclear reactor or particle accelerator and whose experience and training have been approved by the appropriate government agencies authorized to license the use of radionuclides.

How Supplied: Gallium Citrate Ga 67 is supplied sterile and non-pyrogenic for intravenous use. Each ml contains 2mCi of Gallium Ga 67 on the calibration date, as a complex formed from 9mg gallium chloride Ga 67, 2mg of sodium citrate, 6.8mg sodium chloride, and 0.9% benzyl alcohol w/v as preservative. The pH is adjusted to between 4.5-7.5 with hydrochloric acid and/or sodium hydroxide solution.

Vials are available from 3mCi to 18mCi in increments of 3mCi on calibration date.

The contents of the vial are radioactive and adequate shielding and handling precautions must be maintained.

CAUTION: Federal (U.S.A.) law prohibits dispensing without prescription.

**For dependable
imaging...**

Dependable imaging of skeletal lesions—that's what bone scanning is all about. And that's what the unique, dry-mix formulation and stable PCP bond of Osteoscan assure. Osteoscan's diphosphonate formulation, when labeled with ^{99m}Tc , provides:

- ☐ dependably high tagging efficiency
- ☐ rapid blood and soft tissue clearance to assure high target-to-nontarget ratio
- ☐ excellent in vivo stability
- ☐ low tin level—to minimize the potential for liver uptake and interference with subsequent brain scans

For further information about Osteoscan, please contact: Arnold Austin, Technical Manager, Professional Services Division, Procter & Gamble (513) 977-8547.

the dependable diphosphonate

PROCTER & GAMBLE

OSTEOSCAN[®]

(5.9 MG DISODIUM ETIDRONATE, 0.16 MG STANNOUS CHLORIDE)
SKELETAL IMAGING AGENT

In Europe, contact: Philips-Duphar B.V.,
Cyclotron and Isotope Laboratories, Petten, Holland.

See following page for a brief summary of package insert.

PROCTER & GAMBLE

OSTEOSCAN[®]

(5.9MG DISODIUM ETIDRONATE, 0.16MG STANNOUS CHLORIDE)

SKELETAL IMAGING AGENT

Brief summary of Package Insert. Before using, please consult the full Package Insert included in each kit.

DESCRIPTION

Each vial of OSTEOSCAN contains 5.9 mg disodium etidronate and 0.16 mg stannous chloride as active ingredients. Upon addition of ADDITIVE-FREE ^{99m}Tc-pertechnetate, these ingredients combine with ^{99m}Tc to form a stable soluble complex.

ACTIONS (CLINICAL PHARMACOLOGY)

When injected intravenously, ^{99m}Tc-labeled OSTEOSCAN has a specific affinity for areas of altered osteogenesis. Areas of bone which are undergoing neoplastic invasion often have an unusually high turnover rate which may be imaged with ^{99m}Tc-labeled OSTEOSCAN.

Three hours after intravenous injection of 1 ml ^{99m}Tc-labeled OSTEOSCAN, an estimated 40-50% of the injected dose has been taken up by the skeleton. At this time approximately 50% has been excreted in the urine and 6% remains in the blood. A small amount is retained by the soft tissue. The level of ^{99m}Tc-labeled OSTEOSCAN excreted in the feces is below the level detectable by routine laboratory techniques.

INDICATIONS

OSTEOSCAN is a skeletal imaging agent used to demonstrate areas of altered osteogenesis.

CONTRAINDICATIONS

None.

WARNINGS

This radiopharmaceutical should not be administered to patients who are pregnant or lactating unless the information to be gained outweighs the potential hazards.

Ideally, examinations using radiopharmaceuticals, especially those elective in nature, of a woman of childbearing capability should be performed during the first few (approximately 10) days following the onset of menses.

Radiopharmaceuticals should be used only by physicians who are qualified by specific training in the safe use and handling of radionuclides produced by nuclear reactor or particle accelerator and whose experience and training have been approved by the appropriate government agency authorized to license the use of radionuclides.

The ^{99m}Tc-generator should be tested routinely for molybdenum breakthrough and aluminum. If either is detected, the eluate should not be used.

PRECAUTIONS

Both prior to and following ^{99m}Tc-labeled OSTEOSCAN administration, patients should be encouraged to drink fluids. Patients should void as often as possible after the ^{99m}Tc-labeled OSTEOSCAN injection to minimize background interference from accumulation in the bladder and unnecessary exposure to radiation.

As in the use of any other radioactive material, care should be taken to insure minimum radiation exposure to the patient, consistent with proper patient management, and to insure minimum radiation exposure to occupational workers.

ADVERSE REACTIONS

None.

DOSAGE AND ADMINISTRATION

The recommended adult dose of ^{99m}Tc-labeled OSTEOSCAN is 1 ml with a total activity range of 10-15 mCi. ^{99m}Tc-labeled OSTEOSCAN should be given intravenously by slow injection over a period of 30 seconds within eight (8) hours after its preparation. Optimum scanning time is 3-4 hours postinjection.

The patient dose should be measured by a suitable radioactivity calibration system immediately prior to administration.

Count on Picker's Isotope Calibrator.

Picker's digital Isotope Calibrator is easy to operate. Select calibration factor, position sample and push one button. Digital readout is ready in usually less than one second. There are no calculations and no zeroing. The Picker Isotope Calibrator covers all clinically used isotopes from 2 μ Ci to 999mCi.

You can be sure of $\pm 5\%$ accuracy, $\pm 3\%$ short-term repeatability and $\pm 1\%$ long-term stability. A molybdenum breakthrough kit helps assure patient safety. And Picker certifies in writing that each Isotope Calibrator has been checked and calibrated to meet regulatory agencies' recommendations, and is UL listed.

Like all Picker equipment, the Isotope Calibrator is backed by Picker service. Its another example of Picker's synergy — the complete interfacing of systems and services for better diagnoses.

Contact your Picker representative. Or write Picker Corp., Clinical Laboratory Dept., 12 Clintonville Road, Northford, CT 06472.

PICKER[®]

ONE OF THE C.I.T. COMPANIES

State of the art in cardiac and respiratory synchronization.

Cardiac Gate

Cardiac Gate is designed to synchronize the cardiac image exposure with predetermined phases of the cardiac cycle.

The Cardiac Gate has two modes of operation: manual and automatic. In the manual mode, delay and exposure time parameters are set manually, using the R wave of the electrocardiogram as a reference. In the automatic mode, microprocessor circuitry automatically tracks the cardiac cycle and computes the position of end-systole and end-diastole. In the automatic mode, end-systole and end-diastole exposures are made without any calibration settings.

The dual gating operation mode allows recording of both end-systole and end-diastole simultaneously in a split screen two image format.

The cardiac cycle can even be divided into nine equal time segments and the image corresponding to each displayed simultaneously in a nine image format.

The Cardiac Gate includes a complete electrocardiograph module. The built in heated stylus strip chart recorder records both the ECG trace and the gating intervals.

The Cardiac Gate provides both ECG and gating outputs for computer interface.

Opti Imager

Opti-Imager is designed to provide an organ image with effects due to respiratory motion minimized. Opti-Imager has two distinct modes of operation: continuous motion correction and respiratory gating. In the continuous motion correction mode, the motion of the organ is tracked and corrected electronically without the need to attach any sensors to the patient. The distribution of counts within the organ image is monitored and corrections are applied to continuously shift the image before it is displayed to compensate for organ motion. Correction is made for motion in both the X and Y direction. Thus, the gamma camera is not gated and all the counts provided by the detector are recorded. The time required to attain a statistically satisfactory image is the same for both a motion corrected and an uncorrected image. In the gating mode, inspiration plateau and expiration plateau images are recorded. The dual gating operation mode allows recording of both inspiration and expiration plateau images simultaneously in a split screen two frame format. Dual scalars record the number of counts in each image.

The Cardiac Gate and Opti-Imager can be synchronized to yield a combination of both cardiac and respiratory gating. Mail coupon to receive detailed information and sample clinical studies.

MaxiCamera

**Now and in the future...rely on GE
for your nuclear imaging needs.**

Compatible building blocks...permit your MaxiCamera™ system to grow with your needs. You can select equipment to match your requirements now—then add system components such as a GE film Formatter as your department expands. Be confident these components will be compatible with your basic system.

System

It all starts with MaxiCamera...

The 400 mm field of view simplifies imaging for large organ studies. The detector is positioned with ease and precision because of MaxiCamera's gimbal and counterbalance.

You can add a GE Formatter to record up to 42 static or dynamic images on 8 x 10 film and incorporate the camera electronics in the same console. Select data handling systems to fit your needs—from basic acquisition and playback to advanced systems for cardiac and renal studies.

Expand your technic capabilities with an optional Selectascan™ whole body scanner that moves the detector over or under the patient. For easy patient transfer and positioning, include the Universal Imaging Table. And save valuable floor space while simplifying collimator changing with the new Collimator Stacker.

Whether your needs are basic, complex or changing... the MaxiCamera system can satisfy those needs now and in the future. For details, contact your GE representative.

SQUIBB HOSPITAL DIVISION

E. R. Squibb & Sons Inc. Box 4000 Princeton N.J. 08540

We put Potassium Perchlorate in capsules so your pharmacy doesn't have to.

Save time and pharmacy-order paperwork. Keep a 100-capsule bottle of **Perchloracap** on hand at all times. This pre-packaged, inexpensive, convenient dosage form of potassium perchlorate is designed to improve diagnostic certainty when pertechnetate is used as a brain imaging agent. To place an order, simply contact your Mallinckrodt representative or call Mallinckrodt toll free, 800-325-3688. (Missouri customers call collect 314-895-0880.)

Mallinckrodt, Inc.
P.O. Box 5840
St. Louis, Mo. 63134

Just order Mallinckrodt Perchloracap. (Potassium Perchlorate)

Available
for routine use.

Perchloracap.[®]

(Potassium Perchlorate)

We put Potassium Perchlorate in capsules so your pharmacy doesn't have to.

Catalog Number 025
100/200-mg Capsules/Bottle

INDICATIONS

Potassium perchlorate should be administered to minimize the accumulation of pertechnetate Tc-99m in the choroid plexus and in the salivary and thyroid glands in those patients receiving sodium pertechnetate Tc-99m injection for brain and blood pool imaging and placenta localization.

CONTRAINDICATIONS

None.

WARNINGS

Potassium perchlorate has been administered chronically in doses of 200-1000 mg per day for the treatment of hyperthyroidism. Fever, rash, lymphadenopathy, renal damage, agranulocytosis, and fatal aplastic anemia have all been reported as complications of this therapy. Because several alternative therapies for hyperthyroidism are available, **Perchloracap** Capsules are not recommended for treatment of this condition. These adverse effects are dose related and have not been observed in patients receiving single doses of potassium perchlorate under the conditions described under Dosage and Administration.

Use in Pregnancy: The safety of this drug in pregnant women is not known and the agent should not be administered during pregnancy or lactation unless the information to be gained outweighs the predicted hazard.

Do not administer **Perchloracap** Capsules that have been subjected to excessive heat and/or moisture as manifested by deformation and/or discoloration of the capsule.

To prevent loss of the desiccated atmosphere always replace the bottle cap immediately after use.

ADVERSE REACTIONS

Gastric irritation has been reported in therapeutic doses of perchlorate greater than one gram per day. The possibility of temporary local gastric irritation exists with the administration of subtherapeutic doses in capsule form.

DOSAGE AND ADMINISTRATION

The usual adult dose is 200 to 400 milligrams of potassium perchlorate administered orally one-half to one hour before injection of sodium pertechnetate Tc-99m. The maximum dose should not exceed one gram. **Perchloracap** Capsules should be administered with several ounces of water to prevent gastric irritation.

See package insert for prescribing information.

RADIOPHARMACEUTICALS

MALLINCKRODT, INC.
St. Louis, Missouri 63134

WHERE WOULD THE COMPUTER HAVE BEEN, WITHOUT A COLLEGE EDUCATION?

Still an abacus. Probably.

After all, man's first computer was good enough for several thousand years. Till a bunch of college men started experimenting with a new concept called cybernetics.

And suddenly, you have the computer. A billion-dollar business and still counting.

Radio. Television. Plastics. Petrochemicals. The new rice and the new wheat. Hunger-fighters that may save the world from famine.

All products of colleges and college-trained minds.

You don't want the flow of college-bred new ideas, improvements, inventions to stop. Ever. Not if you're a good businessman.

So perhaps you'd better take a good hard look at how much *your* company is giving to higher education. Because inflation has hit colleges and universities even harder than most.

Freedom to experiment is the first casualty of tight budgets.

For the sake of the future, "Give to the college of your choice. Now." Who knows what new billion-dollar business of tomorrow is germinating on some college campus today.

Meletron

The dosecalibrator that calibrates itself (almost)

Radx has now programmed its new Meletron to read its own calibration factors. The Meletron programmable microprocessor allows you to check each of the Isotope Selector Keys for proper multiplication factors.

Radx employs direct mathematical manipulation for the various radionuclides (other dosecalibrators vary the resistance to alter the signal from the ionization chamber to the digital meter) and these factors can now be recalled from memory and displayed on the digital readout. Since each radionuclide has a finite and discrete mathematical factor, the ability to recall and display this factor (as triggered by the Isotope Selector Key) will remove any doubt concerning this aspect of dosecalibration.

Area radiation can also be monitored by the new Meletron. With the key out, "Background - Error" will flash when the radiation level exceeds approximately 2.0 mr/hr (with an unshielded unit).

Area monitoring is standard on Meletron; an extra cost option on other dosecalibrators.

Hard copy data of your radionuclide calibrations is another RADX first. The Melecord prints; time, date, volume, calibration, patient dose, radionuclide — plus it calculates and then prints the volume to administer. Easy compliance with NRC requirements is also assured by Melefile, the RADX record keeping system which provides data cards, tab cards and a compact file to keep them in.

Obsolescence is eliminated. The Meletron employs the latest in microprocessor technology. The highly reliable microprocessor is readily programmable to perform a wide variety of functions. Further program modifications may be added to your unit in the field, as they are developed.

For a permanent solution to your dosecalibration and record-keeping problems, call RADX — the innovators in nuclear medicine. RADX, P. O. Box 19164, Houston, Texas 77024, 713/468-9628.

RADX

Meletron & Melecord . . . your key to accurate dosecalibration and error-free records.

Now you can consult the foremost authorities in the field for answers to your questions on...

COMPUTED TOMOGRAPHY 1977

Consisting of 40 original papers presented at the University of California School of Medicine, San Francisco, this new book contains the latest information on the current status of computed tomography scanning. Designed to give an in-depth review of CT, it incorporates scanning of the liver, pancreas, lymph nodes, genitourinary tract, chest, heart, head and neck. Papers fully discuss physical principles, evaluate and compare available equipment, and examined the effect of CT on radiation therapy treatment planning and health care delivery systems.

Edited by David Norman, M.D.; Melvyn Korobkin, M.D.; and Thomas H. Newton, M.D.; with 29 contributors. February, 1977. Approx. 300 pages, 8 1/2" x 11", illustrated. About \$32.00.

DIAGNOSTIC RADIOLOGY 1977

You'll find the most recent information available on each of the subspecialties of diagnostic radiology in this superb collection of original papers. Leading authorities in their fields contribute 61 concise papers on specific clinical aspects of: gastrointestinal radiology; uro-radiology; pediatric, skeletal and chest radiology; neuroradiology; and mammography. They also discuss the present role and potential for computed tomography in various areas of radiologic diagnosis. The papers were delivered last month at the 20th Annual Postgraduate Course in Diagnostic Radiology of the University of California School of Medicine, San Francisco.

Edited by Alexander B. Margulis, M.D. and Charles A. Gooding, M.D.; with 31 contributors. March, 1977. Approx. 500 pages, 8 1/2" x 11", illustrated. About \$37.50.

You'll also be interested in:

PRACTICAL ATLAS OF CARDIAC SCINTIGRAPHY

In this monumental bilingual (French and English) atlas, the authors define the normal and abnormal appearances encountered in performing three types of studies: scintigraphy of the cardiac cavity; selective coronary artery scintigraphy; and myocardial scintigraphy.

Edited by Pierre de Vernejoul; Dominique Ducassou; Robert Guiraud; Jacques Robert; Jean-Paul Nouel; and Henri Witz. May, 1977. Approx. 250 pages, 8 1/2" x 11", 110 color plates. About \$57.50.

Better yields Better service

with the improved Minitec Generator (Technetium 99m)

Squibb Research recently made modifications in Minitec. As a result, yields are better and more consistent. Small-volume, high-concentration eluates provide maximum flexibility. Wide range of potencies—220, 440, 880, 1330, 1770 and 2220 mCi of ^{99m}Mo—means there's a Minitec generator to meet every lab's needs.

Let CUSTOMTEC™ solve your delivery problems. This free Squibb computer service custom-tailors generator size and delivery schedule to your daily ^{99m}Tc requirements. For more information, mail this coupon to:

This is the calibrator that remembers, computes and puts it in writing.

The CRC-20 dose calibrator incorporates a micro-processor which stores time and activity information for up to 19 formulations of 8 radionuclides.

The CRC-20 is used only once to set concentration; it is never necessary to handle the multidose vial for repeat measurement.

The decay-adjusted volume is calculated and displayed automatically.

Three-copy Radionuclide Dose Computation/Measurement Record. One for the patient's chart, the second for Atomic Energy Commission accountability, the third for billing.

All this to reduce exposure . . . in more ways than one. Like all Capintec Calibrators, the CRC-20 features:

- ☐ Geometry independence
- ☐ Largest sample size (up to 200cc vial)
- ☐ 90+ isotope calibrations
- ☐ Moly-assay capability
- ☐ Sensitivity (0.1 uCi resolution)
- ☐ Exclusive 10 atm argon ionization chamber
- ☐ Replaceable inserts

Our table model

Introducing our Model 450 Four Manual Video Camera. It's a mid-priced, table-top camera that plugs into any imaging system with a video readout—Ultrasound, CT, or Nuclear Medicine computer systems—producing four, 115mm images on a sheet of 8x10 x-ray film.

Dunn did it. We combined the compactness and mechanical simplicity of our Model 400 Camera, with the exceptional quality of the Conrac

SNA 9 monitor. The result is a stand-alone camera, with many of the features of our 600 series cameras, at a price you can stand.

Call us at (415) 957-1600. Or write to Dunn Instruments, 52 Colin P. Kelly Jr. Street, San Francisco, Ca 94107. We'll show you our best feature of all. No commercials.

Dunn Instruments, Inc

THE ORTEC ECAT^{T.M.} SCANNER

Emission Computerized Axial Tomographic

featuring

- The production of whole-body emission and transmission, tomographic and rectilinear images.
- A completely self-contained user-oriented operation.
- The use of positron-emitting radiopharmaceuticals.
- Modular electronics, designed for ease of service and high reliability.
- Rapid, flexible scan capabilities, automatic bed indexing, high-resolution display, and adaptable data processing.

The ECAT (Emission Computerized Axial Tomographic) whole-body scanner uses positron-emitting radiopharmaceuticals for patient imaging.

Developed and manufactured by the Life Sciences Division of Ortec Inc., the ECAT represents an accumulation of the extensive line of research instruments which Ortec supplies. Data acquisition is achieved with standard NIM and CAMAC modules identical to those proven reliable throughout the world in research, industrial, and clinical laboratories. It is this modular approach that not only helps prevent obsolescence but also provides for ease of service should the need ever arise.

The ECAT measures and locates the concentration of a positron-emitting radiopharmaceutical compound, such as $^{68}\text{Ga-EDTA}$, ^{11}CO , or $^{13}\text{NH}_3$, administered to the patient. When a positron annihilates, two gamma rays are emitted in opposite directions. By detecting these gamma rays with electronically collimated opposing detector banks, the ray projection in which the annihilation occurred is determined. This method of detection provides for high resolution, high contrast,

and high sensitivity in a format uniquely suited to reconstruction tomography. Compiling, sorting, and processing these data with a reconstruction algorithm results in a cross-sectional image similar to the images generated by transmission CAT (TCAT) scanners. The difference is that Ortec ECAT images are a measure of the physiology, or function, rather than the morphology, or density, of the structure.

For more information, call or write Life Sciences Division, Ortec Incorporated, 100 Midland Road, Oak Ridge, TN 37830; (615) 482-4411. ECAT trademark owned by Ortec Incorporated.

Your patient looks to you

for the right diagnosis.

It's our business to help you make it.

Our business . . . our only business . . . at Diagnostic Isotopes, is the production of radiopharmaceuticals.

From packaging to in vivo performance, our products reflect our concern with the needs of the nuclear medicine professional.

Constant research and development, consistent attention to quality control and convenient packaging contribute to a product you can use with confidence . . . confidence that the manufacturers of that product are as concerned with excellence as you are.

Diagnostic Isotopes manufactures products for use in brain, kidney, lung and pancreas imaging, skeletal imaging to delineate areas of altered osteogenesis, cerebral blood flow, muscle blood flow, pulmonary function studies, estimate glomerular filtration rate, assess renal perfusion and for the diagnosis of cardiac abnormalities.

When your patient looks to you for the right diagnosis . . . depend on Diagnostic Isotopes to help you make it.

OMNIMEDICAL

POWERFUL!

Now Elscint brings you powerful data processing capability in a low cost, high resolution imaging system.

The new Elscint Dycomette Display Processor's imaging and data processing capabilities will surprise you. It includes many features now found only in far more expensive systems. It acquires and stores high resolution static and dynamic images in a 128 x 128 matrix at up to 32 frames per second and displays them in a 256 x 256 matrix. In 32 gray shades or 16 levels of color. And, it displays dual isotopes or dual camera images in two colors, 16 shades each. Patient information is easily added and the display also functions as a persistence scope saving you thousands on your camera purchase.

While small in size for easy movement from room to room, it offers big capacity built-in data processing capabilities. Its 16K programmable minicomputer plus dual 16 Kbyte display and storage memories greatly expand its patient diagnostic value. Do uniformity corrections, two kinds of smoothing, profiles and slices, frame/cell count displays, histograms, frame arithmetic, dynamic reframing *and more*. With up to 6 ROI's. And, as studies are made, you can build a clinical library with the unit's handy double density floppy discs.

Powerful. Useful. Economical.

Three good reasons to call or write today for complete information.

We'll teach your old calibrator some new tricks.

By retrofitting your present Capintec Calibrator with a CRC-U Computer/Printer Upgrade, we'll teach it to remember activity information for up to 19 formulations of 8 radionuclides.

We'll teach it to calculate and display automatically the decay adjusted volume needed for each dose.

We'll even teach it to print neatly a three-copy Radionuclide Dose Computation/Measurement Record; one for the patient's chart, the second for NRC accountability, the third for billing.

While your present calibrator is away getting smart, we'll loan you a replacement.

Please send more information on the CRC-U

POSITIONS OPEN

NUCLEAR MEDICINE TECHNOLOGIST. Immediate openings for two registered or registry eligible Nuclear Medicine Technologists to work in a University Hospital. Competitive salary and excellent hospital benefits. Apply to: Merton A. Quafie, M.D., Director, Nuclear Medicine, University of Nebraska Medical Center, 42nd and Dewey Avenue, Omaha, Nebraska 68105.

NUCLEAR MEDICINE TECHNOLOGIST. 500-bed medical center is presently seeking a registered or registry eligible nuclear medicine technologist to work in a rapidly expanding nuclear medicine laboratory. Competitive salary and excellent hospital benefits. Reply may be directed to: Joe Wells, Employment Manager, Mt. Carmel Medical Center, 125 South Souder, Columbus, Ohio 43222 (614) 225-5288. An Equal Opportunity Employer—Male/Female.

NUCLEAR MEDICINE TECHNOLOGIST. ASCP or ARRT Registered to work in a rapidly expanding department of a 300 bed medical center with 169 bed satellite hospital utilizing the latest equipment and techniques. Will be required to troubleshoot any situation which may arise and function under limited supervision. Excellent salary, fringe benefits and retirement plan. Contact: Personnel Department, St. Mary Medical Center, 540 Tyler Avenue, Gary, Indiana 46402. 219-882-0930.

NUCLEAR MEDICINE RADIOLOGIST. ABR & ABNM Certification. 700 bed private hospital in northeast Ohio. Affiliated with Northeast Ohio Universities College of Medicine. 10 radiologists, associated in private practice. Contact Dr. Richard Hirsh, Associated Radiologists of Akron, Inc., 525 East Market Street, Akron, Ohio 43309, (216) 375-3576.

NUCLEAR MEDICINE TECHNOLOGIST. Immediate opening for a technician in a fully accredited 370-bed community and university affiliated hospital, situated in scenic northcentral Pennsylvania. Proficiency required in radioimmunoassay work, imaging dynamic studies and computer applications. Department is equipped with cameras, rectilinear scanners, automated well counters and a computer. Good salary and full benefits. Contact Jack D. Cain, Director of Personnel, The Williamsport Hospital, 777 Rural Avenue, Williamsport, PA 17701.

NUCLEAR MEDICINE RESIDENCY. Medical College of Wisconsin. Two year integrated program including 710 bed VA General Hospital, 600 bed County Medical

Complex and two large community hospitals. Several cameras each interfaced to computer. Ultrasound training included. Positions available in July 1977. Nondiscrimination in employment. Contact Robert C. Meade, M.D., Chief, Nuclear Medicine Service, VA Center, Milwaukee, WI 53193. 414-384-2000, EXT 2138.

NUCLEAR MEDICINE TECHNOLOGIST—Atlanta, Georgia. 520 bed teaching hospital has immediate opening in its modern facility for a registered technologist (ARRT or ASCP) or recent graduate of an accredited program. Salary commensurate with education and experience. Contact: Dr. Ernest G. Smith, Jr., Department of Nuclear Medicine, The Crawford W. Long Memorial Hospital of Emory University, 35 Linden Avenue, NE, Atlanta, Georgia 30308. An Equal Opportunity Employer.

NUCLEAR PHARMACIST IMMEDIATE opening in a 1000 bed teaching medical complex. Responsibilities include maintenance of established nuclear pharmacy services, clinical and didactic instruction of radiopharmaceuticals, and involvement in radiopharmaceutical research and product development. Pharmacists (advanced degree preferred) to be considered for this position must be eligible for Ohio licensure with experience and/or training in nuclear pharmacy. Salary commensurate with abilities. Contact: Mr. Edward G. Konld, Associate Director, Department of Pharmacy, Ohio State University Hospitals, 410 West Tenth Avenue, Columbus, Ohio 43210. An Equal Opportunity/Affirmative Action Employer.

NUCLEAR MEDICINE RESIDENCY program. The University of Pittsburgh School of Medicine Nuclear Medicine Residency Program has an opening in an approved two-year program beginning July, 1977 (starting time flexible). The Department serves the Presbyterian-University Hospital (550 beds), the Eye and Ear Hospital of Pittsburgh (172 beds), and Children's Hospital (225 beds), performing a full range of diagnostic studies. Training opportunities are available in related sections in diagnostic ultrasound and CT imaging. Joint program leading to a master's degree in radiation biology also available. Beginning stipend at 5th postgraduate year level (fellowship) \$18,000; 3rd postgraduate year level (resident), \$14,726. An Equal Opportunity/Affirmative Action Employer.

LOCUM TENES-NUCLEAR MEDICINE Physician Wanted July and August, 1977. In Indiana 30 Miles from Chicago, Good Pay. Please reply P.O. Box 401, Society of

Nuclear Medicine, 475 Park Avenue South, New York, NY 10016.

NUCLEAR MEDICINE TECHNICIAN. full time Civil Service positions GS-4, 5, 6, 7 (\$4.00 to \$5.54 ph). Salary dependent upon experience. For a GS-4 must have at least 1½ years of Medical or laboratory experience plus 6 months of experience in Nuclear Medicine or 2 years of post-high school education with at least 12 hours of science. Generally an additional year of experience is needed to qualify for each consecutive grade. Excellent fringe benefits. Contact Personnel Service, VA Hospital, Iowa City, Iowa 5224 or call (319) 338-0581 Ext. 228. The Federal Government is an equal opportunity employer.

NUCLEAR MEDICINE TECHNOLOGIST. Upstate New York Community General Hospital with 450 beds. Excellent fringe benefit package in addition to competitive salary. Experience is essential. Send resume to: Mgr. of Employment, Personnel Services Department, St. Peter's Hospital, Albany, New York 12208.

NUCLEAR MEDICINE RESIDENCY. University of Missouri-Columbia and Harry S. Truman Memorial Veterans Hospital. Two year combined nuclear medicine program beginning 1 July, 1977 with openings for two qualified candidates. Broad basic science and clinical exposure including all in-vitro studies, Ultra-Sound and Computed Tomography. Active staff with opportunity for independent and collaborative research. For further information contact: Richard A. Holmes, M.D., Chief, Nuclear Medicine, University of Missouri Medical Center, N206, Medical Sciences, Columbia, Missouri 65201—314-882-2541.

POSITIONS WANTED

CHIEF NUCLEAR MEDICINE TECHNOLOGIST, ARRT registered. Eight years experience. Capabilities include in vivo and in vitro applications. Expert with most equipment and procedures. Interested in planning, organizing and managing established or new facilities. Prefer to relocate north west or north east U.S. Reply to Box 400, Society of Nuclear Medicine, 475 Park Ave. South, New York, N.Y. 10016.

RADIOPHARMACEUTICAL / MEDICAL Chemist Ph.D. Experienced in Radiopharmaceutical Research, Organic Synthesis and Central Radiopharmacy Operation. Desires position in Radiopharmaceutical R&D. Reply to Hank Kung, Department of Nuclear Medicine, Roswell Park, Buffalo, NY 14263. Phone 716-845-3354.

STANFORD UNIVERSITY SCHOOL OF MEDICINE Nuclear Medicine Residency Program—1977 and 1978

Resident positions are available beginning September 1, 1977 and also September 1, 1978, for a 2-year program at Stanford University Medical Center and affiliate Veterans' Administration Hospital. Patients from the Children's Hospital at Stanford are also studied or treated at the University Hospital.

The program, approved by the AMA and satisfying the requirements of the American Board of Nuclear Medicine, includes didactic instruction in radiologic mathematics and physics, radiation safety, dosimetry, electronics, and nuclear medicine instrumentation. A major portion provides practical experience in dynamic and static imaging, computer-assisted data manipulation, radioimmunoassay methodology, other in vitro test procedures, and radiopharmacy as part of an integrated patient care program, both diagnostic and therapeutic.

Prerequisite for entry into program: 2 years' prior training in AMA-approved program in internal medicine, radiology, pathology or pediatrics.

Stanford is an equal opportunity affirmative action employer. Requests for further information (include C.V. and reference list) should be directed to:

Joseph P. Kriss, M.D., Director, Division of Nuclear Medicine, Stanford University Medical Center, Stanford, CA 94305

JNM CLASSIFIED PLACEMENT SERVICE SECTION

This section in the Journal of Nuclear Medicine contains "Positions Open", "Positions Wanted", and "For Sale" listings. Nondisplay "Positions Wanted" ads by members of the Society are billed at 30¢ per word for each insertion with no minimum rate. Nondisplay "Positions Wanted" ads by nonmembers and all nondisplay "Positions Open" and "For Sale" ads by members and nonmembers are charged at 65¢ per word. Display advertisements are accepted at \$90 for 1/8 page, \$125 for 1/4 page, \$210 for 1/2 page, and \$370 for a full page. Closing date for each issue is the 1st of the month preceding publication. Agency commissions and cash discounts are allowed on display ads only. Box numbers are available for those who wish them.

All classified ads must be prepaid or accompanied by a purchase order. Send orders to:

Journal of Nuclear Medicine, 475 Park Avenue South
New York, N.Y. 10016

...and get it fast with **Phosphotec**[®] Technetium Tc 99m- Pyrophosphate-Tin Kit

Simple two-step procedure

Maintain shielding at all times.

1

Add sterile sodium
pertechnetate ^{99m}Tc
solution to
reaction vial.

2

Shake vial
gently...
assay dose
and
inject IV.

- Excellent labeling efficiency—95% bound at optimum time for scanning (2-4 hours post-injection).
- Rapid skeletal uptake. After two hours, approximately 55% of injected dose localizes in bone.
- Scan evaluation 93% excellent/good in 215 clinical cases (11 investigators)*
- Minimum amount of uptake in soft-tissue organs... little urinary tract visualization.
- Ratio of pyrophosphate to stannous tin: 20.5
- Rapid blood and renal clearance.
- May be used up to 12 hours after reconstitution, stored at 2°-8° C.

*Data on file at the Squibb Institute for Medical Research.

See following page for brief summary.

PHOSPHOTEC[®]

Technetium Tc 99m-Pyrophosphate-Tin Kit

DESCRIPTION: Phosphotec provides all the nonradioactive components required to prepare a sterile, pyrogen-free technetium Tc 99m-pyrophosphate-tin complex. Each reaction vial contains 40 mg. sodium pyrophosphate (equivalent to 23.9 mg. anhydrous sodium pyrophosphate) and 1 mg. stannous fluoride. When sterile, pyrogen-free Sodium Pertechnetate Tc 99m is added to the reaction vial, a technetium Tc 99m-pyrophosphate-tin complex is formed.

INDICATIONS AND USAGE: Technetium Tc 99m-Pyrophosphate-Tin complex may be used as a bone imaging agent to delineate areas of altered osteogenesis.

CONTRAINDICATIONS: None known.

WARNINGS: This product should not be administered to patients who are pregnant or to nursing mothers unless the benefits to be gained outweigh the potential hazards. Ideally, examinations using radiopharmaceuticals, especially those elective in nature, of a woman of childbearing capability should be performed during the first few (approx. 10) days following the onset of menses.

It has been reported that false-positive or false-negative brain scans may result when brain scans using sodium pertechnetate Tc 99m are performed after a bone scan has been done using an agent containing stannous ions, e.g., a pyrophosphate bone agent. This is thought to be due to the interaction of Tc 99m with stannous ions inside red blood cells. Therefore, in those cases where both brain and bone scans are indicated, the brain scan should be performed first, if feasible. Alternatively, another brain imaging agent, such as Tc 99m DTPA, may be employed.

The contents of the Phosphotec reaction vial are intended only for use in the preparation of Technetium Tc 99m-Pyrophosphate-Tin solution and are **not** to be directly administered to the patient. Any sodium pertechnetate 99mTc solution which contains an oxidizing agent is **not** suitable for use with Technetium Tc 99m-Pyrophosphate-Tin Kit. The contents of the kit are not radioactive. However, after sodium pertechnetate 99mTc is added, adequate shielding of the final preparation must be maintained.

PRECAUTIONS: Technetium Tc 99m-Pyrophosphate-Tin solution, as well as other radioactive drugs, must be handled with care and appropriate safety measures should be used to minimize radiation exposure to clinical personnel. Also, care should be taken to minimize radiation exposure to the patients consistent with proper patient management.

Both prior to and following administration of Technetium Tc 99m-Pyrophosphate-Tin solution, the patient should be encouraged to drink fluids and to void as often as possible thereafter to minimize radiation exposure to the bladder and background interference during imaging.

Technetium Tc 99m-Pyrophosphate-Tin solution must be used within 12 hours of reconstitution.

Adequate reproductive studies have not been performed in animals to determine whether this drug affects fertility in males or females, has teratogenic potential, or has other adverse effects on the fetus. This drug should be used in pregnant women only when clearly needed. It is not known whether this drug is excreted in human milk. As a general rule, nursing should not be undertaken while a patient is on the drug since many drugs are excreted in human milk.

Safety and effectiveness in children have not been established.

ADVERSE REACTIONS: No adverse reactions specifically attributable to the use of Technetium Tc 99m-Pyrophosphate-Tin have been reported.

For full prescribing information see package insert.

HOW SUPPLIED: In a kit containing five reaction vials (5 ml. size).

State of the art in gamma camera hard copy recording.

Multi-Imager 1

Multi-Imager 1 employs the CRT of the gamma camera to record static, dynamic, and whole body imaging procedures on transparency format. The highly versatile Multi-Imager 1 offers film size formats of 5x7 and 8x10, yielding superior quality transparency scintiphotos recorded on a wide range of x-ray film processor compatible films. Up to 30 images can be recorded on a single sheet of film in ten different formats. In addition to the usual 1, 4, and 16 image formats, Multi-Imager 1 offers seven further choices to yield the exact diagnostic format required. For example, Multi-Imager 1 offers a 6 image format to allow recording of static studies that require a fifth and sixth view, and a 30 image format for dynamic studies that require more than sixteen frames. For whole body imaging, the 2 image format records side by side AP and PA views on the same sheet of film. Static, dynamic, and different size images can be mixed on the same sheet of film.

Multi-Imager 4

Multi-Imager 4 yields unmatched performance in gamma camera hard copy recording. A built in high resolution CRT, state of the art microprocessor technology, and electronically synchronized multiple lens optics provide a very small dot size on 8x10 format without increasing the pulse pair resolution dead time of the gamma camera system. The fast lens system of Multi-Imager 4 is compatible with both conventional x-ray film and the slower single emulsion radiographic films that provide the best image quality. Up to 64 images can be recorded in ten different formats. The dual intensity recording mode allows simultaneous acquisition of whole body or static views at two different intensity levels. Positive patient identification is achieved through a nine digit keyboard LED system.

Both Multi-Imager 1 and Multi-Imager 4 can provide thousands of dollars in annual film cost savings and are compatible with all gamma cameras. Mail coupon to receive detailed information and sample clinical studies.

Variety is the spice of life

False. Especially false with Radioassay kits. But all too often, variety is what you get. Not with our Vitamin B12 and Folic Acid (Serum and RBC) Kits. DPC pioneered the folates. We set the industry standards: For lot to lot consistency, supersensitivity and superlinear range, rapidity, accuracy and recovery excellence. And the purest, most stable Iodine 125 I tracers with the **lowest blanks available**. Variety of procedures is another problem. Not with our Vitamin B12 and Folic Acid Kits. They're twins. Identical protocols that can be run side by side.

Each comes to you with pre-measured individual calibrators, charcoal-dextran tablet separation and buffer. Each includes lyophilized reagents for longer shelf life and ice free shipping. And each comes to you on time. Maybe it's a little boring, but in RIA, monotony is the spice of life.

**Vitamin B12 and Folic Acid
(Serum and RBC) Kits from DPC.
Consistent quality you can rely on.
Invariably.**

INTRODUCING

the only
fully
automated
pulmonary
investigation
unit with a
permanent gas trap...
to insure your protection!

Here is the Medi-Ray pulmonary investigation unit . . . fully automated, completely enclosed, incorporating a built-in permanent gas trap. That's right, a permanent gas trap that needs no replacing or refilling. This unit represents the ultimate in state-of-the-art technology and insures the safety of the operator.

In addition to this unique capability, the Medi-Ray unit offers a long list of features including complete enclosure of the Xenon delivery and removal system in one unit; large

air bag capacity facilitating extended equilibrium and washout time; compatible with Xenon 133 and Xenon 127; requires no oxygen.

These are only a few of the many features that make the Medi-Ray pulmonary investigation unit the most unique and advanced unit of its kind.

Call us collect at (914) 961-8484 and get the whole story, or write us at Medi-Ray, Inc., 150 Marbledale Road, Tuckahoe, N.Y. 10707.

Medi-Ray, Inc.

Fine Tuned Products...

ACKERMAN NUCLEAR INC. is tuned into the refinement and improvement of Cold Kit imaging reagents. Fine tuning these products, however, is not really as easy as turning a dial or flipping a switch. Years of research and concentrated effort by skilled professionals have gone into bringing the reliability, quality and service of our Cold Kit products up to a standard of dependability and efficiency day after day and batch after batch.

At A.N.I., Cold Kits are our business . . . our only business.

Are you tuned in? If so . . . and you want to know more about our products, call or write:

A Complete ^{133}Xe Gas Control System from RADX

The Complete System for Lung Ventilation Studies

Now you can dispense, administer and dispose of ^{133}Xe safely and economically under controlled conditions with a complete system from Radx. The system is designed to protect the user as well as the environment. Patient comfort, safety and ease of breathing are primary concerns.

The START Xenon-Kow II

^{133}Xe is most economically obtained in curie quantity glass ampules. The Xenon-Kow II was designed to safely and conveniently crush the

ampule and dispense ^{133}Xe in smaller doses. The dynamic volume storage chamber provides for constant concentrations (decay excepted), and transfer efficiencies exceed 98%. The economies realized will pay for the entire system, usually in the first year.

The HEART of the System Ventil-Con

The Ventil-Con controlled gas delivery system is used for patient administration of ^{133}Xe . You may

administer the ^{133}Xe as a bolus or homogenous mixture with air and oxygen to perform the single breath, equilibrium and washout phases of lung ventilation studies.

The FINISH Xenon Trap

The Radx Xenon Trap is the only activated charcoal trap with a built-in ^{133}Xe saturation detector/ alarm. When the charcoal reaches its saturation point, an audio/visual alarm is activated indicating it's time to replace the 6-cylinder cartridge pack. Other features are a large desiccant jar for moisture removal, a "flame isolated" pumping system and an optional expandable interface (pictured).

Call Radx, let us analyze and compare your current cost with our cost.

Estriol results without 24 hour urine collection

New Amersham Estriol RIA Kit

There is only one thing wrong with measuring estriol in urine, and that's the urine. Amersham's new Estriol RIA Kit avoids the time consuming and inconvenient 24-hour urine collection.

- Simple, highly specific RIA method—no solvent extraction or chromatography.
- Only 50 μ l serum or plasma sample.
- Rapid and reproducible results. 5-8% C.V. in an individual hospital.
- Easy gamma counting with I-125 labeled estriol

Benefit to the obstetrician:

no 24-hour wait, high reliability

Benefit to the laboratory:

no urine handling or purifying, easy gamma counting with I-125 labeled estriol, single or serial estimations easily performed

Benefit to the patient:

no inconvenient urine collection, storage, handling and delivery

Complements the clinically-proven HPL RIA Kit from Amersham

Amersham

Brain study, right lateral view
 ^{99m}Tc Pyrophosphate

For the big job of small area work, think Dyna[®]Camera 4 with 11" detector—the nuclear imaging system that delivers 2.1mm (1/12") intrinsic resolution.

Small patient or big patient, the excellent resolution of the Picker 4/11 allows you to visualize small lesions previously impossible to locate, as well as to clearly define the larger lesions.

The new DynaCamera 4/11's unparalleled spatial and energy

resolution is exceptionally useful in cardiac work with low energy radionuclides such as $^{201}\text{Thallium}$ for imaging the myocardium to locate and measure infarcts, for precise region placement in left ventricular ejection fraction studies, and for cardiac output measurements.

Consider 13% energy resolution and $\pm 10\%$ uniformity. Include differential quantification, information density, auto expose and anatomical landmarking.

Compare the image divergence/distortion of competitive 10" detectors to Picker's 11" detector. You'll think Picker when you think smaller.

DynaCamera 4/11 is another example of Picker's synergy—the complete interfacing of systems and services for greatly improved diagnostic visualization.

Contact your local Picker representative. Or write Picker Corporation, 12 Clintonville Road, Northford, CT 06472.

NEW...

**Added protection
against excessive
radiation levels
from radionuclides**

ULTRA-LITE SYRINGE SHIELD

The **LIGHTEST** and **SMALLEST** syringe shield ever made

**Permits unparalleled dexterity
when handling radionuclides.**

- 40% to 60% lighter than any other shielding material, yet offers maximum protection.
- Slim design facilitates injection procedures.
- Virtually indestructible.

**So light and easy to use, you'll check twice
to see if it's in your hand.**

Model	Capacity	Weight	Price
56-292B	2½ to 3 cc	1.4 oz.	\$95.00
56-293B	5 to 6 cc	1.7 oz.	

"L-U-8" VIAL SHIELD*

Unique, all-in-one vial shield offers total radiation protection, from milking to injection. Permits direct measurement of ^{99m}Tc and molybdenum breakthrough without ANY exposure...in one operation.

- All procedures performed without removing vial from shield.
- Fits into detector chamber of all radioisotope calibrators.

Assures total exposure-free control, from milking through measurement and ultimate use... simply, safely, conveniently.

TechneScan® PYP™ Kit

(Stannous Pyrophosphate)

Kit for the Preparation of Technetium Tc 99m Stannous Pyrophosphate Diagnostic—For Intravenous Use

CLINICAL PHARMACOLOGY

When injected intravenously, **TechneScan PYP Tc 99m** has a specific affinity for areas of altered osteogenesis. It is also concentrated in the injured myocardium, primarily in areas of irreversibly damaged myocardial cells.

One to two hours after intravenous injection of **TechneScan PYP Tc 99m**, an estimated 40 to 50 percent of the injected dose has been taken up by the skeleton, and approximately 0.01 to 0.02 percent per gram of acutely infarcted myocardium. Within a period of one hour, 10 to 11 percent remains in the vascular system, declining to approximately 2 to 3 percent twenty-four hours post injection. The average urinary excretion was observed to be about 40 percent of the administered dose after 24 hours.

INDICATIONS AND USAGE

TechneScan PYP Tc 99m is a skeletal imaging agent used to demonstrate areas of altered osteogenesis, and a cardiac imaging agent used as an adjunct in the diagnosis of acute myocardial infarction.

As an adjunct in the diagnosis of confirmed myocardial infarction (ECG and serum enzymes positive), the incidence of false negative images has been found to be 6 percent. False negative images can also occur if made too early in the evolutionary phase of the infarct or too late in the resolution phase. In a limited study involving 22 patients in whom the ECG was positive and serum enzymes questionable or negative, but in whom the final diagnosis of acute myocardial infarction was made, the incidence of false negative images was 23 percent. The incidence of false positive images has been found to be 7 to 9 percent. False positive images have also been reported following coronary by-pass graft surgery, in unstable angina pectoris, old myocardial infarcts and in cardiac contusions.

CONTRAINDICATIONS

None.

WARNINGS

This radiopharmaceutical should not be administered to patients who are pregnant or lactating unless the information to be gained outweighs the potential hazards. Ideally, examinations using radiopharmaceuticals, especially those elective in nature, of a woman of child-bearing capability should be performed during the first few (approximately 10) days following the onset of menses.

Warning: Preliminary reports indicate impairment of brain scans using Tc 99m pertechnetate which have been preceded by bone scan. The impairment may result in false positives or false negatives. It is recommended, where feasible, that brain scans precede bone imaging procedures.

Radiopharmaceuticals should be used only by physicians who are qualified by specific training in the safe use and handling of radionuclides produced by nuclear reactor or particle accelerator and whose experience and training have been approved by the appropriate government agency authorized to license the use of radionuclides. The **TechneScan PYP Kit** must be maintained at refrigerator temperature until use.

The contents of the **TechneScan PYP** reaction vial are intended only for use in the preparation of Technetium Tc 99m Stannous Pyrophosphate and are not to be directly administered to the patient.

Sodium pertechnetate Tc-99m solutions containing an oxidizing agent are not suitable for use with the **TechneScan PYP Kit**.

The contents of the kit are not radioactive. However, after the sodium pertechnetate Tc-99m is added, adequate shielding of the final preparation must be maintained.

TechneScan PYP Tc 99m should not be used more than six hours after preparation.

PRECAUTIONS

As in the use of any other radioactive material, care should be taken to insure minimum radiation exposure to the patient, consistent with proper patient management, and to insure minimum radiation exposure to occupational workers.

Bone Imaging

Both prior to and following **TechneScan PYP Tc 99m** administration, patients should be encouraged to drink fluids. Patients should void as often as possible after the **TechneScan PYP Tc 99m** injection to minimize background interference from accumulation in the bladder and unnecessary exposure to radiation.

Cardiac Imaging

Patient's cardiac condition should be stable before beginning the cardiac imaging procedure.

If not contraindicated by the cardiac status, patients should be encouraged to inject fluids and to void frequently in order to reduce unnecessary radiation exposure.

Interference from chest wall lesions such as breast tumors and healing rib fractures can be minimized by employing the three recommended projections.

ADVERSE REACTIONS

None.

DOSAGE AND ADMINISTRATION

The recommended adult dose of **TechneScan PYP** is:

1. Skeletal Imaging — 5 to 15 millicuries (1 to 14 milligrams stannous pyrophosphate).
2. Cardiac Imaging — 10 to 15 millicuries (4 to 7 milligrams of stannous pyrophosphate).

TechneScan PYP Tc 99m is injected intravenously over a 10- to 20-second period. For optimal results, bone imaging should be done 1 to 6 hours following administration. Cardiac imaging should be done 60 to 90 minutes following administration. The acute myocardial infarct can be visualized from 24 hours to 9 days following onset of symptoms, with maximum localization at 48 to 72 hours. Cardiac imaging should be done with a gamma scintillation camera. It is recommended that images be made of the anterior, left anterior oblique and left lateral projections.

The patient dose should be measured by a suitable radioactivity calibration system immediately prior to administration.

HOW SUPPLIED

Catalog Number—094 **TechneScan PYP Kit**

Kit Contains:

- 5—Stannous Pyrophosphate Reaction Vials (Lyophilized) for the preparation of Technetium Tc 99m Stannous Pyrophosphate.

Reaction Vial Contains:

15.4 mg Sterile Stannous Pyrophosphate (Lyophilized). Hydrochloric acid is added for pH adjustment prior to lyophilization.

- 5—Pressure-sensitive "Caution—Radioactive Material" labels.
- 5—Radioassay Information String Tags.

CALCULATING AUTOMATIC GAMMA COUNTER FOR RADIOIMMUNOASSAY

INTRODUCING PACKARD MODEL 5176

Here is the unique counting system to meet the demands of RIA and related radioassays when automation is needed for the expanding laboratory. Packard's Model 5176 automatically performs all sample changing and RIA calculations for you, allowing you to go from prepared sample to evaluation of results quickly and accurately. And its overall simplicity of design and operation make it ideal for use in clinics and small laboratories. In so many ways, this Packard system is the radioassay system for your laboratory.

5 WAYS BETTER

1 AUTOMATIC CALCULATIONS

Model 5176 automatically performs the calculations needed for controls, standards and samples in RIA—including replicate averages, per cent bound or binding index, reciprocal binding, normalized binding, binding ratios, subtraction of blanks and counts per minute (cpm).

2 SAVES TIME

Technician time is freed from the repetitive tasks required to count samples and reduce data. Changing tubes, pushing buttons, recording numbers—these manual steps are automated. Calculations are performed while the changer operates. At the end of counting only standard, curve plot and dose determination steps remain. There are no further calculations or delays.

3 ERROR ALERT

Automatic calculations provide that the instrument will perform programmed routines with unchanging accuracy, free from human computational error. A built-in automatic "error-signal" alerts the operator to mistakes such as changing preset conditions, entering values that are mathematical impossibilities, or obtaining relationships that exceed normal assay values or ranges.

4 ADVANCED COUNTING FUNCTIONS

All counting can be done to fixed limits of statistical error or to a fixed time, with averaging of up to four samples to reduce error from preparative variations. The instrument can automatically deduct the assay background due to nonspecific binding of the radioactive antigen, or blank

counts due to instrument background.

5 OUTSTANDING FLEXIBILITY

The 5176 System is composed of a manual gamma counter (Model 5105) and an add-on automatic sample changer (Model 5076). By starting or augmenting your radioassay facility with the Packard "manual well", an ability to grow is assured. You can easily automate to handle work loads in excess of 100 tubes daily without acquiring additional computing or counting systems. This system also gives calculation and push-button window capability for uses other than RIA. Or, it can be operated as an ordinary bench-top manual or automatic counter.

Help your cardiologist study heart kinetics non-invasively with Brattle-gated scintiphotos.

RAO, DIASTOLE

RAO, SYSTOLE

LAO, DIASTOLE

LAO, SYSTOLE

The RAO view shows akinesis of the lower antero-lateral wall and apex; and contraction of the inferior wall and high up the antero-lateral wall. The LAO view shows good contrac-

tion posteriorly and akinesis of the septal aspect of the chamber. Patient was injected IV with 20mCi of ^{99m}Tc -labelled Human Serum Albumin. The agent was prepared using the New

England Nuclear Electrolysis Kit for labelling HSA. Write or call for a portfolio of Brattle-gated lung, liver and heart studies.

No knobs, no meters, no errors

The spartan panel above tells the second-best part of our story. If you want to photograph peak systole, press the SYSTOLE button. If, say, you want systole only at full expiration, press the EXPIRATION button as well. If only breathing is relevant, don't press the heart button.

The Brattle is connected to the patient and to your gamma (or x-ray or ultrasonic) camera. Whenever the patient is in the selected phase, both the scope and the scaler on your gamma camera are gated ON, and film is exposed. Otherwise, they are OFF.

Brattles lock onto patients—and stay locked on

It doesn't matter if the patient's heart rate and breathing depth change while he's under the collimator be-

cause we stay right with him. Brattles contain an ECG to track heart, a plethysmograph to track respiration, and a tiny computer to deduce systole and diastole times from the heart signal. And because it's all built in, your operator need not be a physiologist.

We don't cover our tracks—we print them

The panel lights flash whenever the patient reaches the selected phases; and pushing the RECORDER-ON button gets you an ECG tracing marked with breathing and camera-on times. You can verify function before, during and after exposure.

A single pair of axillary electrodes captures both heart and breath

It's easy. And we supply disposable, pre-filled electrodes.

Some Brattles have been in clinical use for over three years—in community and major hospitals

More than half of our instruments are in community hospitals and the list is growing rapidly. Upon request, we'll supply names of happy users in your area.

What's the next step? Get in touch

Ask your NEN man about Brattles and HSA Kits. He can show you a portfolio of clinical pictures and arrange to have one of our people give you a demo. Or write or call us direct. We'll send you brochures on this and other models, and will give you your own set of clinical pictures and a bibliography on gated scintigraphy. If you wish, we'll even make you a Brattle owner. (This is the best part of our story.)

Brattle Instrument Corporation

243 Vassar Street • Cambridge, Massachusetts 02139 • 617-661-0300

You are entering a remarkable era of diagnostic advancement. Instead of being limited to a single imaging method, you will take advantage of many techniques, choosing them to meet your specific diagnostic criteria and the condition of your patient.

Searle is helping shape this era of advancement. Over the past decade, guided by your needs, we have developed sophisticated nuclear imaging instruments to a high degree of performance. Now, the knowledge gained during that time is being applied to the creation of instrumentation in the fields of ultrasound and CT scanning.

What Searle developed yesterday in nuclear imaging, the medical community relies on today. And today we are planning significant advances in ultrasonic, CT, and nuclear imaging. Tomorrow is in view.
