

FIG. 4. Photomicrograph showing infiltration of bone marrow by microscopic focus of mast cells (left). Note presence of moderate nuclear pleomorphism, small nucleoli, and altered nucleus-to-cytoplasm ratio in some cells, consistent with neoplasia. X 650, Trehpine bone-marrow biopsy fixed in B-5 fixative, embedded in Epon 812-Araldite 502 resin and stained with H&E. Electron micrograph of skin lesion from this patient, showing characteristic and abundant electron-dense granules within cytoplasm of mast cells (right). Appearance of mast cell from marrow would be similar.

condition, although rare, should be suspected when a bone scan shows increased activity throughout the skeleton in a patient with urticaria pigmentosa.

FOOTNOTES

* Siemens Pho Con.

† Technicare Dual Probe rectilinear scanner.

ACKNOWLEDGMENTS

We thank Drs. T. K. Shnitka, B. C. Lente, and G. O. Bain and Mrs. H. C. Dierich for their help and support, and Mrs. Mary Laschowski and Mr. Karl Liesner for their assistance in preparing the manuscript.
