

**FIG. 2.** Hepatobiliary scintigraphy (Tc-99m DISIDA, 8.1 mCi). Anterior hepatic views at 15, 30, and 45 min (top row). Anterior hepatic views at 60, 75, and 150 min (bottom row). All images demonstrate acceptable blood clearance of tracer, non-visualization of the gallbladder and intra- and extrahepatic biliary activity, and visualization of right renal pelvis, most of right ureter, and significant urinary bladder activity. Image at 24-hr (not shown) demonstrated only diffuse hepatic and renal activity. Impression: total biliary obstruction, an element of hepatocellular disease, and abnormal visualization of right ureter representing pyeloureterectasis from recent pregnancy.
