

omy and pitfalls, and then covers osteonecrosis, transient osteoporosis or edema, trauma, neoplasms, arthropathies, infection, and pediatric disorders. The reference lists are extensive and current.

The final chapters of the book cover neoplasms, infection, diffuse marrow diseases, and miscellaneous conditions. There are extensive cross-references between chapters, eliminating some of the redundancy that the dual-anatomic and pathophysiologic organization engenders. The MR images have been obtained from modern instrumentation and are clearly reproduced and usefully labeled. Correlative radiographs, CT scans, angiograms, and radionuclide

bone scans are found throughout the book. The text is highly readable and errors are few. The discussions are well-rounded, pointing out not only MRI findings of various conditions, but also the anatomic, pathophysiologic, and physical bases for these findings. A useful subject index is found at the end.

In summary, this second edition of *MRI of the Musculoskeletal System* presents a practical and comprehensive approach to performing and interpreting musculoskeletal MRI examinations.
