

SUPPLEMENTAL FIGURE 1. ROS scavenging abolishes LPS and oxLDL effects. (A) Effects of 10 mM N-acetyl-L-cysteine (NAC; 10 mM) on stimulated ROS production by 24 h treatment with 100ng/ml LPS or 20 μ g/ml oxLDL. Data are mean \pm SD of triplicate samples from a single experiment. (B) Effects of 10 mM NAC on 18 F-FDG uptake stimulated by 100 ng/ml LPS or 20 μ g/ml oxLDL. Data are mean \pm SD of triplicate samples from a single experiment (LPS), or mean \pm SEM of results from two independent experiments (n = 5; oxLDL). ** p < 0.01; † p < 0.0005; ‡ p < 0.0001 compared to cells stimulated without NAC.
