\* Tumor: Background Ratios are calculated for each individual mouse and the reported value is the mean ± SD for the cohort.

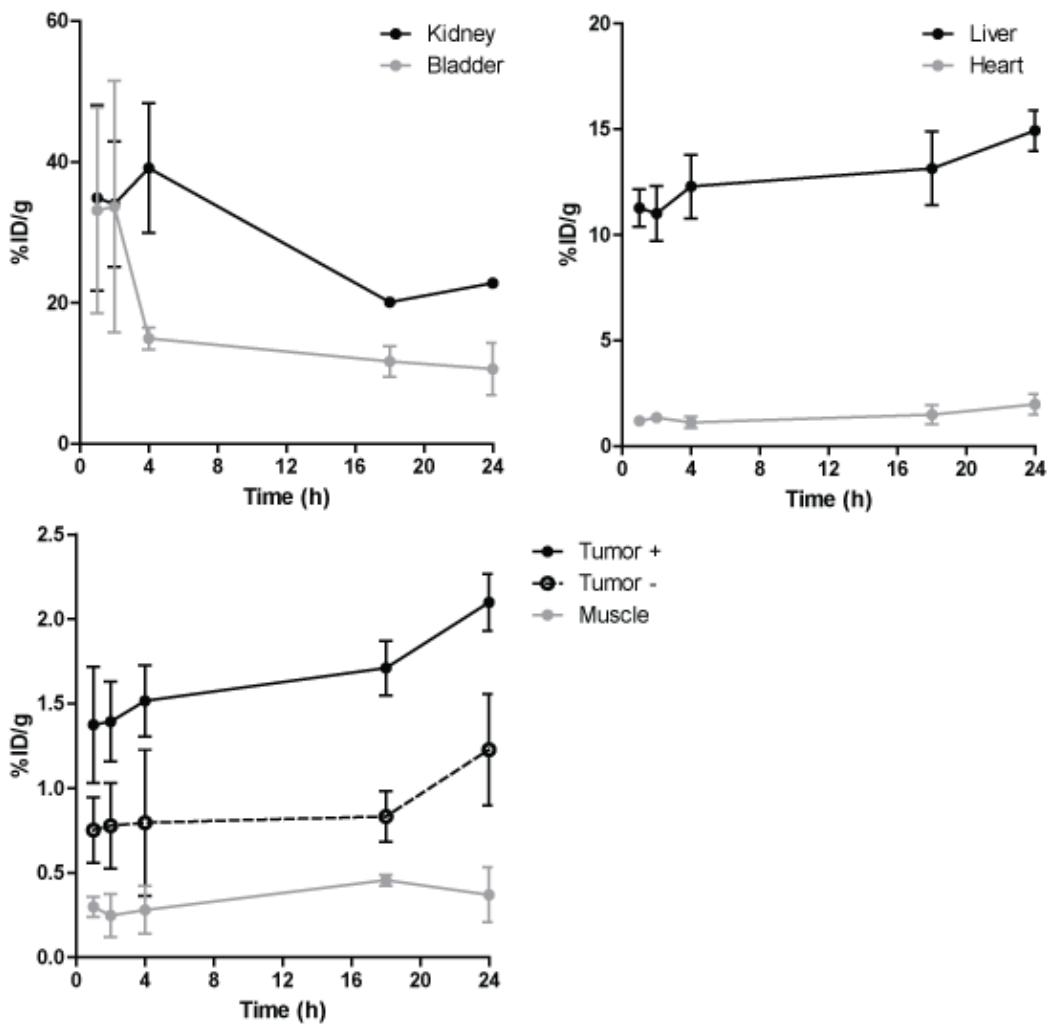

**A. Chelates/Binder****B. Immunoreactivity****C. Radiochemical purity**

*Supplemental Figure 1. Tracer Quality Control.* Representative schematics of: (A) Mass spec determination of number of chelates/ binder. (B) FACS assessment of drop in immunoreactivity after chelation [MFI: median fluorescent intensity] Conjugates were tested for their binding ability on hPD-L1 expressing CT26 cells. Each of the conjugates (200 pM, 100 $\mu$ L) were placed in triplicate vials containing CT26-hPD-L1 cells ( $3 \times 10^5$ ) and kept on ice for 1 h. Cells were washed three times after 1 h with 1%PBSA to remove unbound HACA conjugates. After washing, each of the wells received 100  $\mu$ L of anti-His-tag-APC antibody for FACS staining and were incubated on ice in the dark. After 1 h cells were washed three times and analyzed by FACS. (C) HPLC assessment of purity and specific activity.

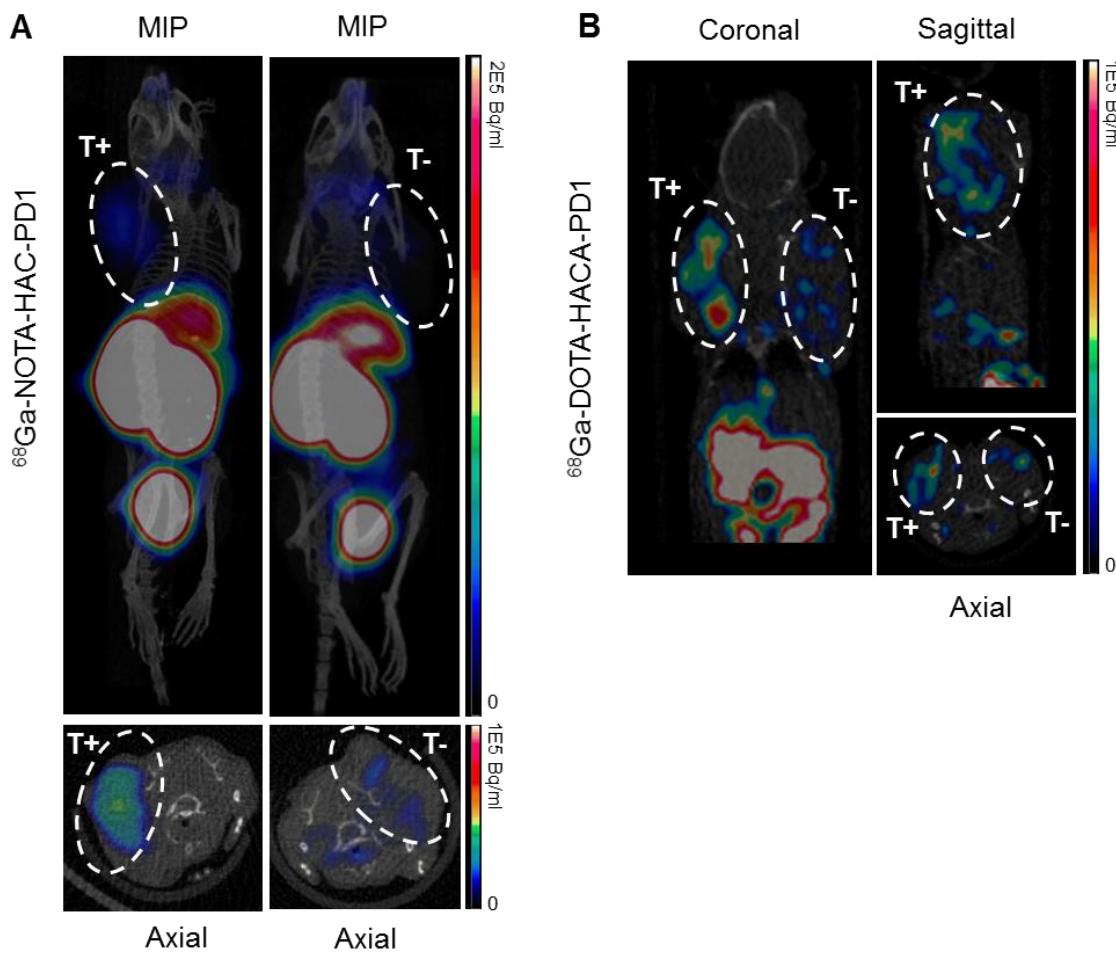

*Supplemental Figure 2.* Human PD-L1 Immune Checkpoint Imaging with <sup>64</sup>Cu Variants in a Single Tumor Model.

MicroPET imaging of hPD-L1 with <sup>64</sup>Cu-DOTA-HAC (A), or <sup>64</sup>Cu-NOTA-HAC (B). From left to right, PET-CT images one hour post injection of tracer (200 $\mu$ Ci/25 $\mu$ g/200 $\mu$ l) in NSG mice bearing subcutaneous CT26 hPD-L1(-) tumor, CT26 hPD-L1(+) blocked tumor, or CT26 hPD-L1(+) tumor. Blocking was performed with 500 $\mu$ g/200 $\mu$ l of unlabeled HAC-PD-1, 2 hours prior to PET tracer. The immunoPET tracer exhibits rapid and highly specific hPD-L1+ tumor uptake which is ideal for potential clinical imaging applications. T-tumor, Li-liver, K-kidneys, SG-salivary glands. Scale bar indicates uptake from 1-6 %ID/g.

*Supplemental Figure 3.* Static PET scans at 1, 2, 4, 18 and 24hrs p.i. of  $^{64}\text{Cu}$ -DOTA-HAC-PD1 in NSG mice bearing dual tumors.

*Supplemental Figure 4.* Human PD-L1 Immune Checkpoint Imaging with  $^{68}\text{Ga}$  Variants. MicroPET imaging of hPD-L1 with  $^{68}\text{Ga}$ -NOTA-HAC (A), or  $^{68}\text{Ga}$ -DOTA-HACA (B) in single and dual tumor bearing mice 1h P.I. respectively. Dashed line demarcates tumor. MIP, Maximum intensity projection; T+, hPD-L1+; T-, hPD-L1-.

*Supplemental Video 1.*  $^{64}\text{Cu}$ -DOTA-HAC-PD1 MIP 1h p.i. (~50  $\mu\text{Ci}/10 \mu\text{g}/200 \mu\text{l}$ ) of NSG mouse bearing dual subcutaneous tumors in shoulders (right = hPD-L1+; left = hPD-L1-). Colors represent 1%(blue) – 6%(red) ID/g.

*Supplemental Video 2.*  $^{64}\text{Cu}$ -NOTA-HAC-PD1 MIP 1h p.i. (~50  $\mu\text{Ci}/10 \mu\text{g}/200 \mu\text{l}$ ) of NSG mouse bearing dual subcutaneous tumors in shoulders (right = hPD-L1+; left = hPD-L1-). Colors represent 1%(blue) – 6%(red) ID/g.

*Supplemental Video 3.*  $^{64}\text{Cu}$ -NOTA-HACA-PD1 MIP 1h p.i. (~50  $\mu\text{Ci}/10 \mu\text{g}/200 \mu\text{l}$ ) of NSG mouse bearing dual subcutaneous tumors in shoulders (right = hPD-L1+; left = hPD-L1-). Colors represent 1%(blue) – 6%(red) ID/g.
