Detailed cluster peak locations and p-values of the voxel-based morphometry analysis at  $p_{unc} < 0.005$  with cluster extent ( $K_E$ ) 250 voxels.

$K_E$ , cluster size extent (number of  $2 \times 2 \times 2 \text{ mm}^3$  voxels);  $p_{cor}$ , corrected for multiple comparisons;  $p_{unc}$ , uncorrected for multiple comparisons; L, left; R, right.

**Supplemental Fig 1** Striatal grey matter volumes (normalized to total intra-cranial volume) in community controls (Com-CON) and gene-negative controls from HD families (Gen-Neg-CON).

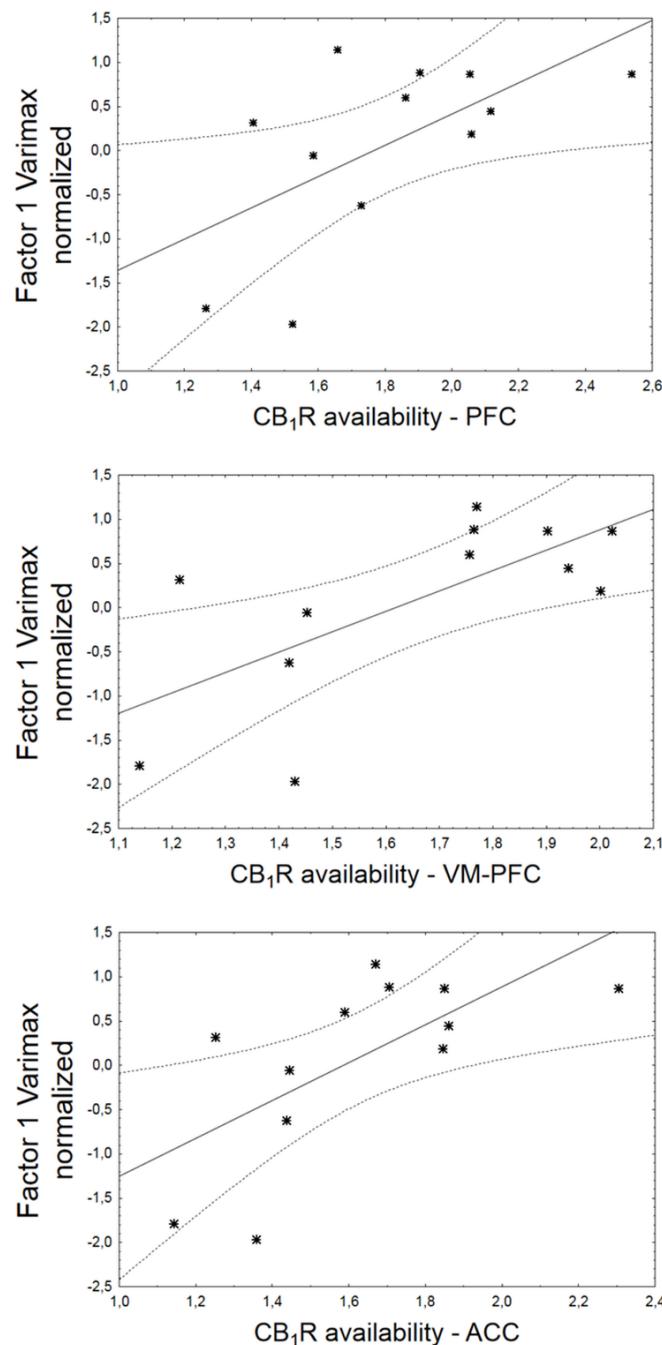

**Supplemental Fig 2** CB<sub>1</sub> receptor (CB<sub>1</sub>R) availability (expressed in modified standardized uptake value, mSUV) in community controls (Com-CON) and gene-negative controls from HD families (Gen-Neg-CON) after PVE correction.

There were no significant differences in any region (range  $p = 0.5 - 0.9$ ).

PFC = prefrontal cortex; DL-PFC = dorsolateral prefrontal cortex; VL-PFC = ventrolateral prefrontal cortex; VM-PFC = ventromedial prefrontal cortex; OFC = orbitofrontal cortex; Mesotmp = mesotemporal lobe; ACC = anterior cingulate cortex; PCC = posterior cingulate cortex; CBL = cerebellum. Error bars represent SD.

**Supplemental Fig 3** Positive correlations between individual scores for factor 1 varimax normalized and CB<sub>1</sub>R availability in prefrontal cortex (PFC) regions (PFC:  $r = 0.61, p = 0.036$ ; ventromedial prefrontal cortex, VM-PFC:  $r = 0.69, p = 0.013$ ) and anterior cingulate cortex (ACC:  $r = 0.67, p = 0.018$ ).

Solid lines represent linear regression curve and dotted lines represent 95% confidence interval.
